The variety of weak Heyting algebras was introduced by Celani and Jansana in [2] as a possible generalization of Heyting algebras. Among its interesting subvarieties are the variety of RWH-algebras and the variety of subresiduated lattices, the latter introduced in the 1970's by Epstein and Horn [3] and constituting a subvariety of the variety of RWH-algebras.

In this talk we will describe and study the implicative subreducts of RWH-algebras [1], which will be called IRWH-algebras, using some ideas and techniques previously applied in [4] to the study of the implicative subreducts of subresiduated lattices. In particular, we will provide a quasi-equational base for the quasivariety of IRWH-algebras, and we will also study the relative congruences of IRWH-algebras as well as the quasivariety generated by the totally ordered IRWH-algebras. Furthermore, we will establish several connections between the results obtained in [1] for IRWH-algebras and those presented in [4] for the implicative subreducts of subresiduated lattices.
